

Amendments to Claims:

Please amend the claims as shown below.

1. (Currently Amended) A system for terrestrial transmission of RF signals comprising:  
  
an antenna, where said antenna includes an active device and a passive device,  
  
where the passive device receives RF signals, where the active device includes a plurality of RF signal amplification stages and a plurality of IF signal amplification stages; and  
  
a decoder connected to the antenna, where decoder receives and analyzes IF signals from said antenna and upon receipt the IF signals sends commands to the active device in order to maintain an acceptable IF signal, where the decoder sends commands that selectively activate or deactivate at least one of the RF signal amplification stages and at least one of the IF signal amplification stages.
2. (Original) The system according to claim 1, where said active device down converts the RF signals to the IF signals.
3. (Cancelled)
4. (Currently Amended) The system according to claim 1, 3, where the at least one RF signal amplification stage amplifier applies a gain onto the RF signals based upon commands from the decoder.
5. (Currently Amended) The system according to claim 1, 3, where the at least one IF signal amplification stage amplifier applies a gain onto the IF signals based upon commands from the decoder.

6. (Currently Amended) The system according to claim 1 3, where the at least one RF signal amplification stage and IF signal amplification stage amplifier applies a gain onto the RF signals and IF signals based upon commands from the decoder.
7. (Original) The system according to claim 1, where the passive device receives RF signals from a satellite and a broadcast center.
8. (Currently Amended) The system according to claim 1 3, wherein each RF signal amplification stage and IF signal amplification stage the at least one amplifier includes at least one of a low noise amplifier and a low noise block converter.
9. (Original) The system according to claim 3, wherein the at least one amplifier may apply a gain of about 20 dB to about 91 dB.
10. (Original) The system according to claim 9, wherein the decoder selectively adjusts the gain from about 20 dB to about 91 dB based upon the IF signals.
11. (Original) The system according to claim 1, where the commands sent by the decoder are using a DiSEqC process.
12. (Cancelled)
13. (Cancelled)
14. (Currently Amended) The system according to claim 1 43, where said commands and IF signals are transmitted upon a single wire connecting the decoder and antenna.
15. (Currently Amended) A method for a terrestrial transmission of RF signals comprising the steps of:  
receiving RF signals via an antenna;

downconverting RF signals to IF signals;  
transmitting the IF signals via a wire to a decoder;  
using a plurality of RF signal amplification stages for RF signal adjustment;  
using a plurality of IF signal amplification stages for IF signal adjustment;  
transmitting commands via the wire to the antenna from the decoder upon receipt of the IF signals;  
selectively adjusting the RF signals and the IF signals based upon the commands; and  
maintaining an acceptable IF signal for receipt by the decoder.

16. (Cancelled)

17. (Currently Amended) The method according to claim 16, further comprising the step of:  
using at least one of a low noise amplifier and a low noise block converter within each  
respective RF signal amplification stage or IF signal amplification stage ~~to execute the~~  
~~step of amplifying.~~

18. (Currently Amended) The method according to claim 16, wherein the step of amplifying  
applies a gain of about 25 ~~20~~ dB to about 91 dB.

19. (Cancelled)

20. (Cancelled)

21. (Cancelled)

22. (Original) The method according to claim 15, further comprising the step of:  
amplifying the RF signals and the IF signals based upon the commands.

23. (Original) The method according to claim 22, further comprising the step of:

- using at least one of a low noise amplifier and a low noise block converter to execute the step of amplifying.
24. (Original) The method according to claim 22, wherein the step of amplifying applies a gain of about 20 ~~25~~ dB to about 91 dB.
25. (Original) The method according to claim 15, wherein the RF signal originates from a satellite and a broadcast center.
26. (Original) The method according to claim 15, further comprising the step of:  
using a DiSEqC process for the commands.
27. (Currently Amended) The method according to claim 18, further comprising the step of:  
selectively activating the gain in order to execute the step of maintaining an acceptable IF signal.
28. (Cancelled)
29. (Currently Amended) The method according to claim 24, further comprising the step of:  
selectively activating the gain in order to execute the step of maintaining an acceptable IF signal.
30. (Currently Amended) A system for terrestrial transmission of RF signals comprising:  
an antenna, where said antenna includes an active device and a passive device, where the active device includes a plurality of RF signal amplification stages and a plurality of IF signal amplification stages ~~at least one amplifier~~ and the passive device receives RF signals, where the active device down converts the RF signals to IF signals and applies a gain to at least one of the RF signals and the IF signals; and

a decoder connected to the antenna, where decoder receives and analyzes the IF signals from said antenna and upon receipt of the IF signals sends commands to the active device in order to maintain an acceptable IF signal, where said commands instruct the active device to selectively activate or deactivate at least one of the RF signal amplification stages and at least one of the IF signal amplification stages selectively adjust the gain.

31. (Currently Amended) The system according to claim 30, wherein the gain applied may be about 20 25 dB to about 91dB.
32. (Original) The system according to claim 30, wherein the at least one amplifier selectively applies a gain to both the RF signals and IF signals based upon the commands.
33. (Original) The system according to claim 30, where the at least one amplifier includes a low noise amplifier and a low noise block converter.
34. (Original) The system according to claim 30, where the commands are using a DSEqC process.
35. (Original) The system according to claim 30, where the commands and IF signals are transmitted upon a single wire connecting the decoder and antenna
36. (Currently Amended) A system for terrestrial transmission of RF signals comprising:  
a plurality of antennas, where each antenna includes an active device and a passive device, where the passive device receives RF signals, and the active device down converts the RF signals to IF signals said active device further includes a plurality of RF signal amplification stages and a plurality of IF signal amplification stages;  
a plurality of master decoders, where each master decoder receives and analyzes the IF

signals from each antenna and upon receipt of the IF signals sends commands to each respective active device that selectively activate or deactivate at least one of the RF signal amplification stages and at least one of the IF signal amplification stages in order to maintain an acceptable IF signal; and

a distribution switch, where said distribution switch receives each IF signal transmitted through each master decoder and transmits each IF signal to a plurality of end user decoders, where each end user decoder receives and analyzes the IF signals from said distribution switch and upon receipt of the IF signals sends commands to the distribution switch that selectively activate or deactivate at least one of the RF signal amplification stages and at least one of the IF signal amplification stages in order to maintain an acceptable IF signal.

37. (Currently Amended) The system according to claim 36, where each active device of each antenna ~~includes at least one amplifier and~~ selectively applies a gain to at least one of the RF signals and IF signals based upon commands from each respective master decoder.
38. (Currently Amended) The system according to claim 36, where each active device of each antenna ~~includes at least one amplifier and~~ selectively applies a gain to both the RF signals and IF signals based upon commands from each respective master decoder.
39. (Original) The system according to claim 36, where said distribution switch includes a plurality of amplifiers that connect to the plurality of end user decoders, each respective amplifier selectively applying a gain to each respective IF signal based upon the commands of each respective end user decoder.

Applicant: Ducasse  
Serial No.: 10/625,806  
Page 8

40. (Original) The system according to claim 36, where said distribution switch transmits IP signal to at least one further distribution switch, wherein at least one further decoder connects the distribution switch to the at least one further distribution switch.
